

R4i WebView adds hardware and software portability to your Interactive Electronic Technical Publications (IETP) distribution.

Now, maintainers and operators can access technical information directly from the R4i Common Source Database (CSDB) regardless of the devices operating system or browser type.

Integrated with R4i CSDB Server, access to content within **R4i WebView** is managed by your publishing team. The **R4i WebView** displays the information in real-time including images and PDF files and is one of the modules available in the R4i S1000D software suite and includes unlimited users per server.

A scalable solution, the R4i WebView application can connect to multiple R4i Content repositories. When used in conjunction with the R4i Content Distribution and Management Server (CDMS), users are automatically connected to secondary R4i WebView servers in the event of a network failure.

R4i WebView offers flexible support for:

- Both XML and SGML content
- All S1000D DTD/Schema types from v1.7 to v4.2
- Viewing S1000D, MIL-STD and ATA iSpec data
- IE, Firefox, Chrome, Edge and Safari
- User access control and content security

Microsoft Internet Information Server running on Windows Server 2012, 2012 R2 or 2016, powers the R4i WebView system. We also recommend 16 GB of system memory.
